

Post-assembly Data Analysis

- Quantification: get expression for each gene in each sample
- Genes differentially expressed between samples
- Clustering/network analysis
- Identifying over-represented functional categories in DE genes
- Evaluation of the quality of the assembly

Part 1. Abundance estimation using RSEM

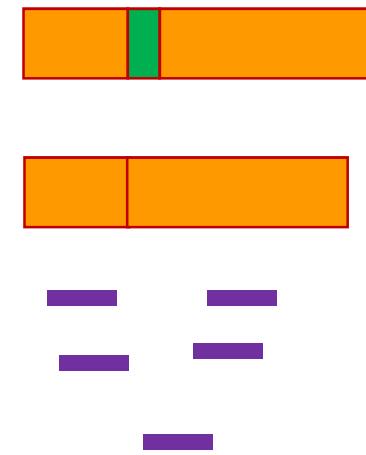

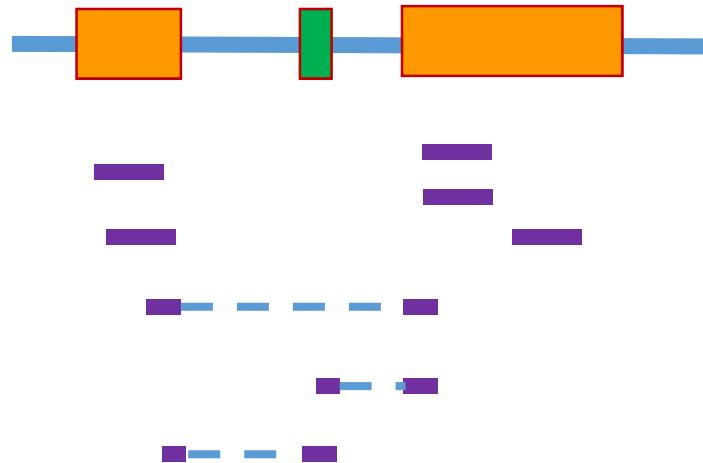

Different summarization strategies will result in the inclusion or exclusion of different sets of reads in the table of counts.

Map reads to genome (TOPHAT)

vs

Map reads to Transcriptome (BOWTIE)

What is easier?

No issues with alignment across splicing junctions.

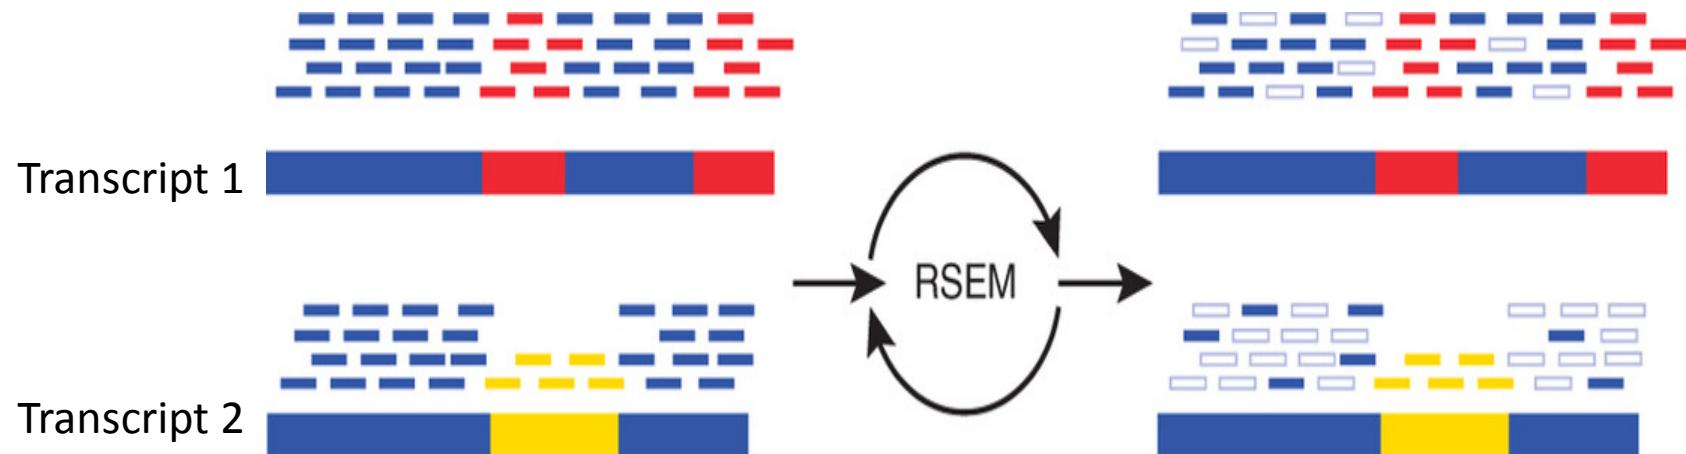

What is more difficult?

The same reads could be repeatedly aligned to different splicing isoforms, and paralogous genes.

RSEM assign ambiguous reads based on unique reads mapped to the same transcript.

Red & yellow: unique regions

Blue: regions shared between two transcripts

Trinity provides a script for calling BOWTIE and RSEM

align_and_estimate_abundance.pl

```
align_and_estimate_abundance.pl \
    --transcripts Trinity.fasta \
    --seqType fq \
    --left sequence_1.fastq.gz \
    --right sequence_2.fastq.gz \
    --SS_lib_type RF \
    --aln_method bowtie \
    --est_method RSEM \
    --thread_count 4 \
    --trinity_mode \
    --output_prefix tis1rep1 \
```

Parameters for align_and_estimate_abundance.pl

--aln_method: alignment method

Default: “bowtie” .

Alignment file from other aligner might not be supported.

--est_method: abundance estimation method

Default : RSEM, slightly more accurate.

Optional: eXpress, faster and less RAM required.

--thread_count: number of threads

--trinity_mode: the input reference is from Trinity.

Non-trinity reference requires a gene-isoform mapping file
(--gene_trans_map).

Output files from RSEM (two files per sample)

*.isoforms.results table

transcript_id	gene_id	length	effective_length	expected_count	TPM	FPKM	IsoPct
gene1_isoform1	gene1	2169	2004.97	22.1	3.63	3.93	92.08
gene1_isoform2	gene1	2170	2005.97	1.9	0.31	0.34	7.92
...							

*.genes.results table

gene_id	transcript_id(s)	length	effective_length	expected_count	TPM	FPKM
gene1	gene1_isoform1 , gene1_isoform2	2169.1	2005.04	24	3.94	4.27
...						

Output files from RSEM (two files per sample)

*.isoforms.results table

transcript_id	gene_id	length	effective_length	expected_count	TPM	FPKM	IsoPct
gene1_isoform1	gene1	2169	2004.97	22.1	3.63	3.93	92.08
gene1_isoform2	gene1	2170	2005.97	1.9	0.31	0.34	7.92
...							Percentage of an isoform in a gene

*.genes.results table

gene_id	transcript_id(s)	length	effective_length	expected_count	TPM	FPKM
gene1	gene1_isoform1 ,gene1_isoform2	2169.1	2005.04	24	3.94	4.27
...						

sum

Filtering transcriptome reference based on RSEM

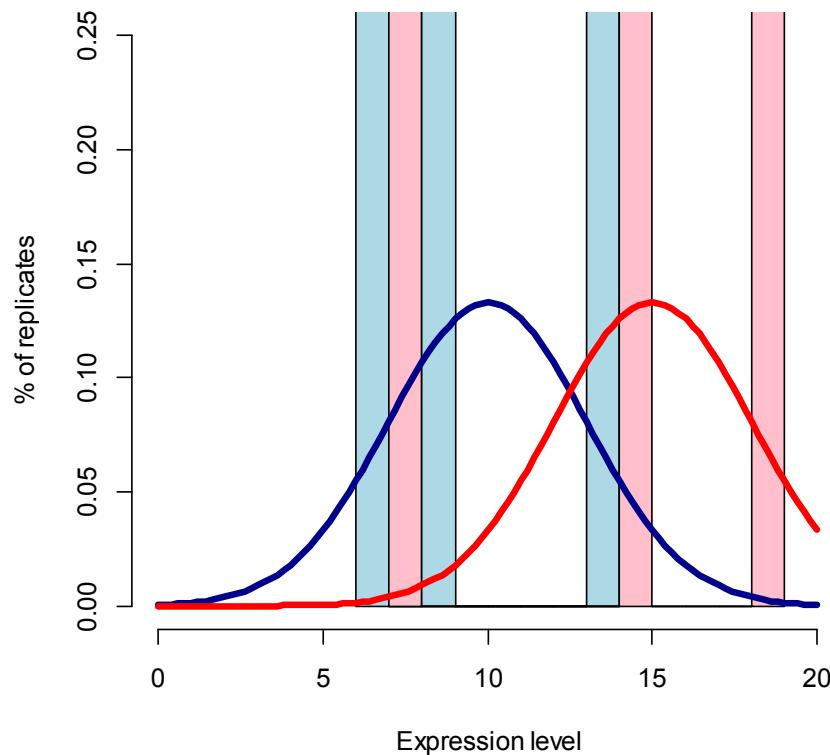

filter_fasta_by_rsem_values.pl

```
filter_fasta_by_rsem_values.pl \
--rsem_output=s1.isoforms.results,s2.isoforms.results \
--fasta=Trinity.fasta \
--output=Trinity.filtered.fasta \
--isopct_cutoff=5 \
--fpkm_cutoff=10 \
--tpm_cutoff=10 \
```

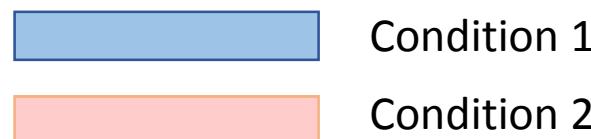

- Can be filtered by multiple RSEM files simultaneously. (criteria met in any one file will be filtered)

Part 2. Differentially Expressed Genes

... with 3 biological replicates in each species

Distribution of Expression Level of A Gene

Use EdgeR or DESeq to identify DE genes

Reported for each gene:

- Normalized read count (Log2 count-per-million);
- Fold change between biological conditions (Log2 fold)
- Q(FDR).

Using FDR, fold change and read count values to filter:

E.g. $\text{Log2(fold)} > 2 \text{ or } < -2$
 $\text{FDR} < 0.01$
 $\text{Log2(counts)} > 2$

Combine multiple-sample RSEM results into a matrix

```
abundance_estimates_to_matrix.pl \
--est_method RSEM \
s1.genes.results \
s2.genes.results \
s3.genes.results \
s4.genes.results \
--out_prefix mystudy
```

Output file: mystudy.counts.matrix

	s1	s2	s3	s4	
TR10295 c0_g1	0	0	0	0	0
TR17714 c6_g5	51	70	122	169	
TR23703 c1_g1	0	0	0	0	
TR16168 c0_g2	1	1	1	0	
TR16372 c0_g1	10	4	65	91	
TR12445 c0_g3	0	0	0	0	
.....					

Use `run_DE_analysis.pl` script to call `edgeR` or `DESeq`

Make a condition-sample mapping file

```
contition1    s1  
condition1    s2  
condition2    s3  
condition2    s4
```

Run script `run_DE_analysis.pl`

```
run_DE_analysis.pl  
--matrix mystudy.counts.matrix  
--samples_file mysamples  
--method edgeR  
--min_rowSum_counts 10  
--output edgeR_results
```

Skip genes with summed read counts less than 10

Output files from run_DE_analysis.pl

	logFC	logCPM	PValue	FDR
TR8841 c0_g2	13.28489	7.805577	3.64E-20	1.05E-15
TR14584 c0_g2	-12.9853	7.507117	2.82E-19	4.04E-15
TR16945 c0_g1	-13.3028	7.823384	4.21E-18	3.11E-14
TR15899 c3_g2	9.485185	7.708629	5.35E-18	3.11E-14
TR8034 c0_g1	-10.1468	7.836908	5.42E-18	3.11E-14
TR3434 c0_g1	-12.909	7.431009	1.16E-17	5.55E-14

Filtering (done in R or Excel):

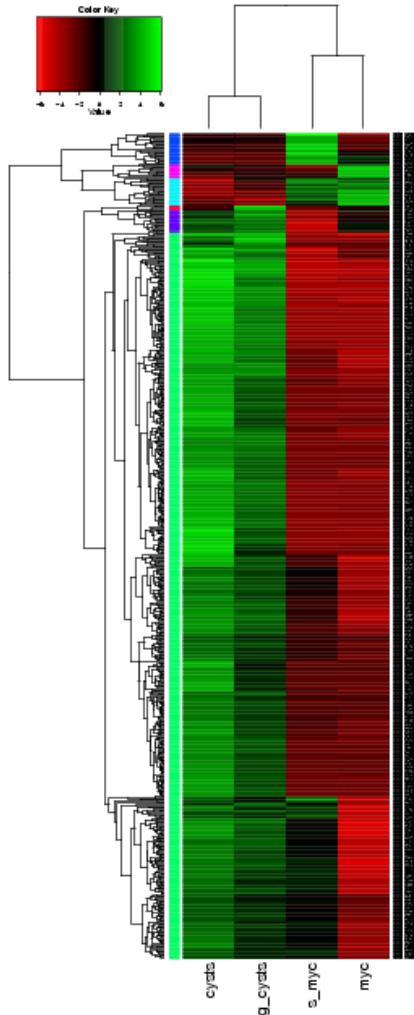

FDR: False-discovery-rate of DE detection (0.05 or below)

logFC: fold change log2(fc)

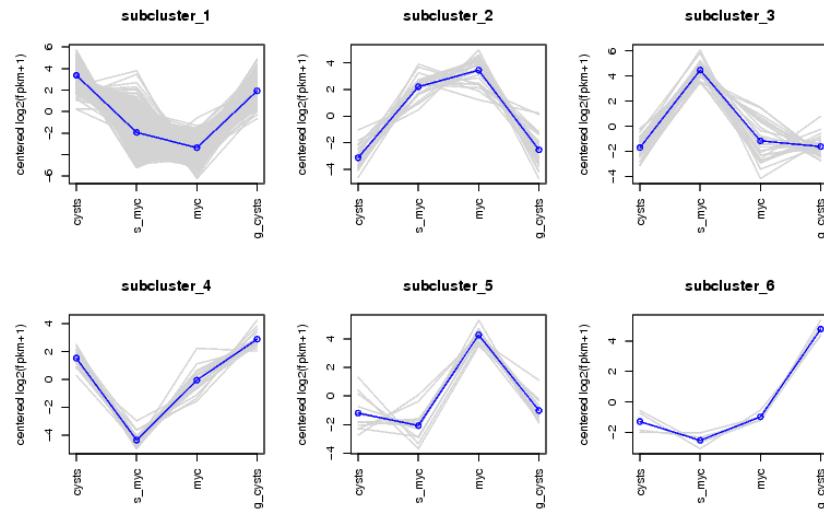

logCPM: average expression level (count-per-million)

Part 3. Clustering/Network Analysis

Heat map and Hierarchical clustering

K-means clustering

Clustering tools in Trinity package

```
# Heap map  
analyze_diff_expr.pl  
  --matrix ../mystudy.TMM.fpkm.matrix  
  --samples ../mysamples  
  -P 1e-3 -C 2  
  
# K means clustering  
define_clusters_by_cutting_tree.pl  
  -K 6 -R cluster_results.matrix.RData
```

Output:

Images in PDF format;

Gene list for each group from K-means analysis;

Part 4. Functional Category Enrichment Analysis

Gene list

(from DE or clustering)

TR14584|c0_g2

TR16945|c0_g1

TR8034|c0_g1

TR3434|c0_g1

TR13135|c1_g2

TR15586|c2_g4

TR14584|c0_g1

TR20065|c2_g3

TR1780|c0_g1

TR25746|c0_g2

GO enrichment analysis

Enriched GO categories

GO ID	over represented pvalue	FDR	GO term
GO:0044456	3.40E-10	3.78E-06	synapse part
GO:0050804	1.49E-09	8.29E-06	regulation of synaptic transmission
GO:0007268	5.64E-09	2.09E-05	synaptic transmission
GO:0004889	1.00E-07	0.00012394	acetylcholine-activated cation-selective channel activity
GO:0005215	1.23E-07	0.000136471	transporter activity

Function annotation

1. Predict open-reading-frame (DNA -> protein sequence)

```
TransDecoder -t Trinity.fasta --workdir transDecoder -S
```

2. Predict gene function from sequences

Trinotate package

- BLAST Uniprot : homologs in known proteins
- PFAM: protein domain)
- SignalP: signal peptide)
- TMHMM: trans-membrane domain
- RNAMMER: rRNA

Output:

go_annotations.txt (Gene Ontology annotation file)

Step-by-step guidance: <https://cbsu.tc.cornell.edu/lab/userguide.aspx?a=software&i=143#c>

Enrichment analysis

```
run_GOseq.pl  
  --genes_single_factor DE.filtered.txt  
  --GO_assignments go_annotations.txt  
  --lengths genes.lengths.txt
```

Use the geneIDs in
the first column

GO annotation file
from Trinotate

3rd column from
RSEM *.genes.results
file

Part 5. Evaluation of Assembly Quality

Compare the *Drosophila yakuba* assembly used in the exercise to *Drosophila melanogaster* proteins from flybase

#hit_pct_cov_bin	count_in_bin	>bin_below
100	5165	5165
90	1293	6458
80	1324	7782
70	1434	9216
60	1634	10850
50	1385	12235
40	1260	13495
30	1091	14586
20	992	15578
10	507	16085

BLAST against *D. melanogaster* protein database

```
Blastx  
-query Trinity.fasta  
-db melanogaster.pep.all.fa  
-out blastx.outfmt6  
-evaluate 1e-20  
-num_threads 6 \
```

Analysis the blast results and generate histogram

```
analyze_blastPlus_topHit_coverage.pl  
blastx.outfmt6  
Trinity.fasta  
melanogaster.pep.all.fa
```
